Best Regards Paul,

I thought I'd drop you a quick note on the success of one of your products which I am using in a nontraditional application of MotorSilk. As the manufacturer of the premier super braid fishing line, **Power Pro**, we operate several thousand NEB braiders of various sizes. These machines, while very reliable, require considerable attention to lubrication needs. This fact is what led my quest to find a lubrication solution that was as revolutionary as our **Power Pro** super braid.

I obtained a bottle of MotorSilk to use for a trial application. I had several of my mechanics pick out a cross-section of about 200 braiders for the trials. Let me tell you that the results were spectacular. Traditionally, we have been using a readily available petroleum product recommended for overcoming the friction and wear which is attributed to the sliding of the bobbin carriers (both CI and nylon) in their associated tracks. With the petroleum based oil, our application schedule was normally twice a week. Given that we had to lube thousands of braiders, this particular PM task was daunting at best. The great news is that our trials showed that, after the initial applications (about two weeks, every other day) we can go at least **Three Weeks** without lubing the carriers. This has allowed me to direct my mechanics to other PM tasks that we never seem to find time for.

Thankfully, the science that developed a "high tech" product for a traditional vehicle wear and friction problem was able to cross over into an industrial solution to considerably benefit our company. Perhaps you can see why I ordered MotorSilk to use as our new, normal lube for this application. Thanks and you can bet I'll be looking for other applications.

Sincerely,

Mel Langland
Maintenance Manager
